Land and Vitals

Electronically file and manage official records

Land and Vitals makes the clerk and recorder's office more efficient by automating the management of deeds, marriage licenses, death certificates and other land and vital recording documents. Manage new and existing recordings through the entire process of scanning, recording, indexing and storage into a searchable digital document repository. The open architecture design and superior userlevel customizability allows for multiple document-receiving departments to share one system, but remain independent in their process and filing.

Documents are carefully and securely processed with optional double-blind or auto-indexing capabilities to reduce human error when sorting and filing records. After submission and review, documents can be automatically or manually indexed an redacted before storage, with appropriate role-based user permissions for a complete, stable, intuitive solution.

Paperless records management

Easily redact and index documents

Access for multiple department

ROAM

Enable Rapid Online Access Method (ROAM) for Land and Vitals to allow public access to multiple department records from a single location on your website. Advanced search capabilities provide near-instant results for citizens.

EACCEPT

Pair eAccept with ROAM to simplify the collection of online payments for document filings and requests. Securely process one time payments for individual transactions, or allow for flat monthly fees for subscription like document access.
